(54) Title: HETEROCYCLIC TRIPEPTIDES AS HEPATITIS C INHIBITORS

(57) Abstract: Compounds of formula (I): wherein R¹ is hydroxyl or sulfonamide derivative; R² is t-butyl or -CH₂-C(CH₃)₃ or -CH₂-cyclopentyl; R³ is t-butyl or cyclohexyl and R⁴ is cyclobutyl, cyclopentyl or cyclohexyl; or a pharmaceutically acceptable salt thereof, are described as useful as inhibitor of the HCV NS3 protease.

HETEROCYCLIC TRIPEPTIDES AS HEPATITIS C INHIBITORS

FIELD OF THE INVENTION

The present invention relates to compounds, processes for their synthesis,
5 compositions and methods for the treatment of hepatitis C virus (HCV) infection. In particular, the present invention provides novel peptide analogs, pharmaceutical compositions containing such analogs and methods for using these analogs in the treatment of HCV infection.

10 BACKGROUND OF THE INVENTION

Hepatitis C virus (HCV) is the major etiological agent of post-transfusion and community-acquired non-A non-B hepatitis worldwide. It is estimated that over 200 million people worldwide are infected by the virus. A high percentage of carriers become chronically infected and many progress to chronic liver disease, so-called
15 chronic hepatitis C. This group is in turn at high risk for serious liver disease such as liver cirrhosis, hepatocellular carcinoma and terminal liver disease leading to death.

The mechanism by which HCV establishes viral persistence and causes a high rate
20 of chronic liver disease has not been thoroughly elucidated. It is not known how HCV interacts with and evades the host immune system. In addition, the roles of cellular and humoral immune responses in protection against HCV infection and disease have yet to be established. Immunoglobulins have been reported for prophylaxis of transfusion-associated viral hepatitis, however, the Center for
25 Disease Control does not presently recommend immunoglobulins treatment for this purpose. The lack of an effective protective immune response is hampering the development of a vaccine or adequate post-exposure prophylaxis measures, so in the near-term, hopes are firmly pinned on antiviral interventions.

30 Various clinical studies have been conducted with the goal of identifying pharmaceutical agents capable of effectively treating HCV infection in patients afflicted with chronic hepatitis C. These studies have involved the use of interferon-alpha, alone and in combination with other antiviral agents. Such studies have shown that a substantial number of the participants do not respond to these

therapies, and of those that do respond favorably, a large proportion were found to relapse after termination of treatment.

Until recently, interferon (IFN) was the only available therapy of proven benefit
5 approved in the clinic for patients with chronic hepatitis C. However the sustained response rate is low, and interferon treatment also induces severe side-effects (i.e. retinopathy, thyroiditis, acute pancreatitis, depression) that diminish the quality of life of treated patients. Recently, interferon in combination with ribavirin has been approved for patients non-responsive to IFN alone. However, the side effects
10 caused by IFN are not alleviated with this combination therapy. Pegylated forms of interferons such as PEG-Intron® and Pegasys® can apparently partially address these deleterious side-effects but antiviral drugs still remain the avenue of choice for oral treatment of HCV.

15 Therefore, a need exists for the development of effective antiviral agents for treatment of HCV infection that overcome the limitations of existing pharmaceutical therapies.

HCV is an enveloped positive strand RNA virus in the Flaviviridae family. The single
20 strand HCV RNA genome is approximately 9500 nucleotides in length and has a single open reading frame (ORF) encoding a single large polyprotein of about 3000 amino acids. In infected cells, this polyprotein is cleaved at multiple sites by cellular and viral proteases to produce the structural and non-structural (NS) proteins. In the case of HCV, the generation of mature nonstructural proteins (NS2, NS3, NS4A,
25 NS4B, NS5A, and NS5B) is effected by two viral proteases. The first one, as yet poorly characterized, cleaves at the NS2-NS3 junction (henceforth referred to as NS2/3 protease); the second one is a serine protease contained within the N-terminal region of NS3 (NS3 protease) and mediates all the subsequent cleavages downstream of NS3, both in *cis*, at the NS3-NS4A cleavage site, and in *trans*, for the
30 remaining NS4A-NS4B, NS4B-NS5A, NS5A-NS5B sites. The NS4A protein appears to serve multiple functions, acting as a cofactor for the NS3 protease and possibly assisting in the membrane localization of NS3 and other viral replicase components. The complex formation of the NS3 protease with NS4A seems necessary to the processing events, enhancing the proteolytic efficiency at all of the

sites. The NS3 protein also exhibits nucleoside triphosphatase and RNA helicase activities. NS5B is a RNA-dependent RNA polymerase that is involved in the replication of HCV.

- 5 A general strategy for the development of antiviral agents is to inactivate virally encoded enzymes that are essential for the replication of the virus.

The following is a list of patent applications published in the last few years that disclose HCV NS3 protease inhibitor peptide analogs that are structurally different
10 from the compounds of the present invention:

GB 2,337,262; JP10298151; JP 11126861; JP 11292840; JP 2001-103993;

20

One advantage of the present invention is that it provides tripeptide compounds that are inhibitory to the NS3 protease, an enzyme essential for the replication of the hepatitis C virus.

- 25 A further advantage of one aspect of the present invention resides in the fact that the compounds specifically inhibit the NS3 protease and do not show significant inhibitory activity against other serine proteases such as human leukocyte elastase (HLE), porcine pancreatic elastase (PPE), or bovine pancreatic chymotrypsin, or cysteine proteases such as human liver cathepsin B (Cat B). Furthermore, the
30 compounds are active in cell culture and have good pharmacokinetic profile *in vivo*.

A further advantage of the present invention is that it provides compounds that are orally bioavailable in mammals.

SUMMARY OF THE INVENTION

Included in the scope of the invention is a compound of formula (I):

- 5 wherein **R¹** is hydroxy or **NHSO₂R^{1A}** wherein **R^{1A}** is (C₁₋₈)alkyl, (C₃₋₇)cycloalkyl or {(C₁₋₆)alkyl-(C₃₋₇)cycloalkyl}, which are all optionally substituted from 1 to 3 times with halo, cyano, nitro, O-(C₁₋₆)alkyl, amido, amino or phenyl, or **R^{1A}** is C₆ or C₁₀ aryl which is optionally substituted from 1 to 3 times with halo, cyano, nitro, (C₁₋₆)alkyl, O-(C₁₋₆)alkyl, amido, amino or phenyl; **R²** is t-butyl, -CH₂-C(CH₃)₃, or -CH₂-
 10 cyclopentyl; **R³** is t-butyl or cyclohexyl and **R⁴** is cyclobutyl, cyclopentyl, or cyclohexyl; or a pharmaceutically acceptable salt thereof.

- Included within the scope of this invention is a pharmaceutical composition comprising an anti-hepatitis C virally effective amount of a compound of formula I, or
 15 a pharmaceutically acceptable salt thereof, in admixture with a pharmaceutically acceptable carrier medium or auxiliary agent.

- According to one embodiment, the pharmaceutical composition of this invention further interferon (pegylated or not), or ribavirin, or one or more other anti-HCV
 20 agents, or any combination of the above.

- Another important aspect of the invention involves a method of treating a hepatitis C viral infection in a mammal by administering to the mammal an anti-hepatitis C virally effective amount of a compound of formula I, a pharmaceutically acceptable
 25 salt thereof, or a composition as described above, alone or in combination with one or more of: interferon (pegylated or not), or ribavirin, or one or more other anti-HCV agent, administered together or separately.

Another important aspect of the invention involves a method of preventing a hepatitis C viral infection in a mammal by administering to the mammal an anti-hepatitis C virally effective amount of a compound of formula I, a therapeutically acceptable salt thereof, or a composition as described above, alone or in
 5 combination with one or more of: interferon (pegylated or not), or ribavirin, or one or more other anti-HCV agent, all of which administered together or separately.

Also within the scope of this invention is the use of a compound of formula I, as
 10 described herein, for the manufacture of a medicament for the treatment or prevention of hepatitis C viral infection.

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

Definitions

15

As used herein, the following definitions apply unless otherwise noted:

With reference to the instances where (*R*) or (*S*) is used to designate the absolute configuration of a substituent or asymmetric centre of a compound of formula I, the designation is done in the context of the whole compound and not in the context of
 20 the substituent or asymmetric centre alone.

The designation "P1, P2, and P3" as used herein refer to the position of the amino acid residues starting from the C-terminus end of the peptide analogs and extending towards the N-terminus (i.e. P1 refers to position 1 from the C-terminus, P2: second
 25 position from the C-terminus, etc.) (see Berger A. & Schechter I., Transactions of the Royal Society London series B257, 249-264 (1970)).

As used herein the term "(1*R*, 2*S*)-vinyl-ACCA" refers to a compound of formula:

30 namely, (1*R*, 2*S*) 1-amino-2-ethenylcyclopropylcarboxylic acid.

The term "(C₁₋₆)alkyl" as used herein, either alone or in combination with another

substituent, means acyclic, straight or branched chain alkyl substituents containing from 1 to 6 carbon atoms and includes, for example, methyl, ethyl, propyl, butyl, 1-methylethyl, 1-methylpropyl, 2-methylpropyl, 1,1-dimethylethyl and hexyl.

Similarly, the term "(C₁₋₈)alkyl" means acyclic, straight or branched chain alkyl
5 containing 1 to 8 carbon atoms, e.g. octyl.

The term "(C₃₋₇)cycloalkyl" as used herein, either alone or in combination with another substituent, means a cycloalkyl substituent containing from 3 to 7 carbon atoms and includes cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl and cycloheptyl.

10

The term "{(C₁₋₆)alkyl-(C₃₋₇)cycloalkyl}" as used herein means a cycloalkyl radical containing from 3 to 7 carbon atoms directly linked to an alkylene radical containing 1 to 6 carbon atoms; for example, cyclopropylmethyl, cyclopentylethyl, cyclohexylmethyl, cyclohexylethyl and cycloheptylpropyl. In the instance where R^{4A}
15 is a {(C₁₋₆)alkyl-(C₃₋₆)cycloalkyl}, this group is attached to the SO₂ group via the (C₁₋₆)alkyl (i.e. the alkylene portion).

20

The term "C₆ or C₁₀ aryl" as used herein, either alone or in combination with another radical, means either an aromatic monocyclic group containing 6 carbon atoms or an aromatic bicyclic group containing 10 carbon atoms. For example, aryl includes phenyl, 1-naphthyl or 2-naphthyl.

25

The term "O-(C₁₋₆)alkyl" as used herein, either alone or in combination with another radical, means the radical -O-(C₁₋₆)alkyl wherein alkyl is as defined above containing up to six carbon atoms, and includes methoxy, ethoxy, propoxy, 1-methylethoxy, butoxy and 1,1-dimethylethoxy. The latter radical is known commonly as *tert*-butoxy.

30

The term "halo" as used herein means a halogen substituent selected from bromo, chloro, fluoro or iodo.

The term "pharmaceutically acceptable salt" means a salt of a compound of formula (I) which is, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation,

allergic response, and the like, commensurate with a reasonable benefit/risk ratio, generally water or oil-soluble or dispersible, and effective for their intended use.

The term includes pharmaceutically-acceptable acid addition salts and pharmaceutically-acceptable base addition salts. Lists of suitable salts are found in, e.g., S.M. Birge et al., J. Pharm. Sci., 1977, 66, pp. 1-19, which is hereby incorporated by reference in its entirety.

The term "pharmaceutically-acceptable acid addition salt" means those salts which retain the biological effectiveness and properties of the free bases and which are not biologically or otherwise undesirable, formed with inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, sulfamic acid, nitric acid, phosphoric acid, and the like, and organic acids such as acetic acid, trifluoroacetic acid, adipic acid, ascorbic acid, aspartic acid, benzenesulfonic acid, benzoic acid, butyric acid, camphoric acid, camphorsulfonic acid, cinnamic acid, citric acid, digluconic acid, ethanesulfonic acid, glutamic acid, glycolic acid, glycerophosphoric acid, hemisulfic acid, hexanoic acid, formic acid, fumaric acid, 2-hydroxyethanesulfonic acid (isethionic acid), lactic acid, hydroxymaleic acid, malic acid, malonic acid, mandelic acid, mesitylenesulfonic acid, methanesulfonic acid, naphthalenesulfonic acid, nicotinic acid, 2-naphthalenesulfonic acid, oxalic acid, pamoic acid, pectinic acid, phenylacetic acid, 3-phenylpropionic acid, pivalic acid, propionic acid, pyruvic acid, salicylic acid, stearic acid, succinic acid, sulfanilic acid, tartaric acid, p-toluenesulfonic acid, undecanoic acid, and the like.

The term "pharmaceutically-acceptable base addition salt" means those salts which retain the biological effectiveness and properties of the free acids and which are not biologically or otherwise undesirable, formed with inorganic bases such as ammonia or hydroxide, carbonate, or bicarbonate of ammonium or a metal cation such as sodium, potassium, lithium, calcium, magnesium, iron, zinc, copper, manganese, aluminum, and the like. Particularly preferred are the ammonium, potassium, sodium, calcium, and magnesium salts. Salts derived from pharmaceutically-acceptable organic nontoxic bases include salts of primary, secondary, and tertiary amines, quaternary amine compounds, substituted amines including naturally occurring substituted amines, cyclic amines and basic ion-exchange resins, such as methylamine, dimethylamine, trimethylamine, ethylamine, diethylamine,

triethylamine, isopropylamine, tripropylamine, tributylamine, ethanolamine, diethanolamine, 2-dimethylaminoethanol, 2-diethylaminoethanol, dicyclohexylamine, lysine, arginine, histidine, caffeine, hydrabamine, choline, betaine, ethylenediamine, glucosamine, methylglucamine, theobromine, purines, piperazine, piperidine, N-ethylpiperidine, tetramethylammonium compounds, tetraethylammonium compounds, pyridine, N,N-dimethylaniline, N-methylpiperidine, N-methylmorpholine, dicyclohexylamine, dibenzylamine, N,N-dibenzylphenethylamine, 1-phenamine, N,N'-dibenzylethylenediamine, polyamine resins, and the like. Particularly preferred organic nontoxic bases are isopropylamine, diethylamine, ethanolamine, trimethylamine, dicyclohexylamine, choline, and caffeine.

The term "antiviral agent" as used herein means an agent (compound or biological) that is effective to inhibit the formation and/or replication of a virus in a mammal. This includes agents that interfere with either host or viral mechanisms necessary for the formation and/or replication of a virus in a mammal. Antiviral agents include, for example, ribavirin, amantadine, VX-497 (merimepodib, Vertex Pharmaceuticals), VX-498 (Vertex Pharmaceuticals), Levovirin, Viramidine, Ceplene (maxamine), XTL-001 and XTL-002 (XTL Biopharmaceuticals).

The term "other anti-HCV agent" as used herein means those agents that are effective for diminishing or preventing the progression of hepatitis C related symptoms of disease. Such agents can be selected from: antiviral agents, immunomodulatory agents, inhibitors of HCV NS3 protease, inhibitors of HCV polymerase or inhibitors of another target in the HCV life cycle.

The term "immunomodulatory agent" as used herein means those agents (compounds or biologicals) that are effective to enhance or potentiate the immune system response in a mammal. Immunomodulatory agents include, for example, class I interferons (such as α -, β -, δ - and omega interferons, tau-interferons, consensus interferons and asialo-interferons), class II interferons (such as γ -interferons) and pegylated interferons.

The term "inhibitor of HCV NS3 protease" as used herein means an agent (compound or biological) that is effective to inhibit the function of HCV NS3 protease

in a mammal. Inhibitors of HCV NS3 protease include, for example, those compounds described in WO 99/07733, WO 99/07734, WO 00/09558, WO 00/09543, WO 00/59929 or WO 02/060926, the Boehringer Ingelheim clinical candidate identified as BILN 2061 and the Vertex/Eli Lilly pre-development candidate identified as VX-950 or LY-570310. Particularly, compounds # 2, 3, 5, 6, 8, 10, 11, 18, 19, 29, 30, 31, 32, 33, 37, 38, 55, 59, 71, 91, 103, 104, 105, 112, 113, 114, 115, 116, 120, 122, 123, 124, 125, 126 and 127 disclosed in the table of pages 224-226 in WO 02/060926, can be used in combination with the compounds of the present invention .

10

The term "inhibitor of HCV polymerase" as used herein means an agent (compound or biological) that is effective to inhibit the function of an HCV polymerase in a mammal. This includes, for example, inhibitors of HCV NS5B polymerase. Inhibitors of HCV polymerase include non-nucleosides, for example, those compounds described in:

15

- US Application No. 10/198,680, which corresponds to PCT/CA02/01127, both filed 18 July 2002 (Boehringer Ingelheim),
- US Application No. 10/198,384, which corresponds to PCT/CA02/01128, both filed 18 July 2002 (Boehringer Ingelheim),
- 20 - US Application No. 10/198,259, which corresponds to PCT/CA02/01129, both filed 18 July 2002 (Boehringer Ingelheim),
- WO 02/100846 A1 and WO 02/100851 A2 (both Shire),
- WO 01/85172 A1 and WO 02/098424 A1 (both GSK),
- WO 00/06529 and WO 02/06246 A1 (both Merck),
- 25 - WO 01/47883 and WO 03/000254 (both Japan Tobacco) and
- EP 1 256 628 A2 (Agouron).

Furthermore other inhibitors of HCV polymerase also include nucleoside analogs, for example, those compounds described in:

- WO 01/90121 A2 (Idenix),
- 30 - WO 02/069903 A2 (Biocryst Pharmaceuticals Inc.), and
- WO 02/057287 A2 and WO 02/057425 A2 (both Merck/Isis).

Specific examples of inhibitors of an HCV polymerase, include JTK-002, JTK-003 and JTK-109 (Japan Tobacco).

The term "inhibitor of another target in the HCV life cycle" as used herein means an agent (compound or biological) that is effective to inhibit the formation and/or replication of HCV in a mammal other than by inhibiting the function of the HCV NS3 protease. This includes agents that interfere with either host or HCV viral mechanisms necessary for the formation and/or replication of HCV in a mammal. Inhibitors of another target in the HCV life cycle include, for example, agents that inhibit a target selected from a helicase, an HCV NS2/3 protease and an internal ribosomeal entry site (IRES). A specific example of inhibitors of another target in the HCV life cycle include ISIS-14803 (ISIS Pharmaceuticals).

The term "HIV inhibitor" as used herein means an agents (compound or biological) that is effective to inhibit the formation and/or replication of HIV in a mammal. This includes agents that interfere with either host or viral mechanisms necessary for the formation and/or replication of HIV in a mammal. HIV inhibitors include, for example, nucleosidic inhibitors, non-nucleosidic inhibitors, protease inhibitors, fusion inhibitors and integrase inhibitors.

The term "HAV inhibitor" as used herein means an agent (compound or biological) that is effective to inhibit the formation and/or replication of HAV in a mammal. This includes agents that interfere with either host or viral mechanisms necessary for the formation and/or replication of HAV in a mammal. HAV inhibitors include Hepatitis A vaccines, for example, Havrix[®] (GlaxoSmithKline), VAQTA[®] (Merck) and Avaxim[®] (Aventis Pasteur).

The term "HBV inhibitor" as used herein means an agent (compound or biological) that is effective to inhibit the formation and/or replication of HBV in a mammal. This includes agents that interfere with either host or viral mechanisms necessary for the formation and/or replication of HBV in a mammal. HBV inhibitors include, for example, agents that inhibit HBV viral DNA polymerase or HBV vaccines. Specific examples of HBV inhibitors include Lamivudine (Epivir-HBV[®]), Adefovir Dipivoxil, Entecavir, FTC (Coviracil[®]), DAPD (DXG), L-FMAU (Clevudine[®]), AM365 (Amrad), Ldt (Telbivudine), monoval-LdC (Valtorcitabine), ACH-126,443 (L-Fd4C) (Achillion), MCC478 (Eli Lilly), Racivir (RCV), Fluoro-L and D nucleosides, Robustafavone, ICN

2001-3 (ICN), Bam 205 (Novelos), XTL-001 (XTL), Imino-Sugars (Nonyl-DNJ) (Synergy), HepBzyme; and immunomodulator products such as: interferon alpha 2b, HE2000 (Hollis-Eden), Theradigm (Epimmune), EHT899 (Enzo Biochem), Thymosin alpha-1 (Zadaxin®), HBV DNA vaccine (PowderJect), HBV DNA vaccine
5 (Jefferon Center), HBV antigen (OraGen), BayHep B® (Bayer), Nabi-HB® (Nabi) and Anti-hepatitis B (Cangene); and HBV vaccine products such as the following: Engerix B, Recombivax HB, GenHevac B, Hepacare, Bio-Hep B, TwinRix, Comvax, Hexavac.

- 10 The term "class I interferon" as used herein means an interferon selected from a group of interferons that all bind to receptor type I. This includes both naturally and synthetically produced class I interferons. Examples of class I interferons include α -, β -, omega interferons, tau-interferons, consensus interferons, asialo-interferons.
- 15 The term "class II interferon" as used herein means an interferon selected from a group of interferons that all bind to receptor type II. Examples of class II interferons include γ -interferons.

Specific preferred examples of some of these agents are listed below:

- 20
- antiviral agents: ribavirin and amantadine;
 - immunomodulatory agents: class I interferons, class II interferons and pegylated interferons;
 - inhibitor of another target in the HCV life cycle that inhibits a target selected from: NS3 helicase, HCV NS2/3 protease or internal ribosome entry site (IRES);
- 25
- HIV inhibitors: nucleosidic inhibitors, non-nucleosidic inhibitors, protease inhibitors, fusion inhibitors and integrase inhibitors; or
 - HBV inhibitors: agents that inhibit HBV viral DNA polymerase or is an HBV vaccine.

- 30 As discussed above, combination therapy is contemplated wherein a compound of formula (1), or a pharmaceutically acceptable salt thereof, is co-administered with at least one additional agent selected from: an antiviral agent, an immunomodulatory agent, another inhibitor of HCV NS3 protease, an inhibitor of HCV polymerase, an inhibitor of another target in the HCV life cycle, an HIV inhibitor, an HAV inhibitor

and an HBV inhibitor. Examples of such agents are provided in the Definitions section above. These additional agents may be combined with the compounds of this invention to create a single pharmaceutical dosage form. Alternatively these additional agents may be separately administered to the patient as part of a multiple dosage form, for example, using a kit. Such additional agents may be administered to the patient prior to, concurrently with, or following the administration of wherein a compound of formula (1), or a pharmaceutically acceptable salt thereof.

As used herein, the term "treatment" means the administration of a compound or composition according to the present invention to alleviate or eliminate symptoms of the hepatitis C disease and/or to reduce viral load in a patient.

As used herein, the term "prevention" means the administration of a compound or composition according to the present invention post-exposure of the individual to the virus but before the appearance of symptoms of the disease, and/or prior to the detection of the virus in the blood.

Preferred embodiments

Preferred are compounds of formula 1 as defined above wherein R^1 is hydroxy, $NHSO_2Me$, $NHSO_2$ -cyclopropyl, or $NHSO_2Ph$. More preferably, R^1 is $NHSO_2Me$ or hydroxy. Most preferably, R^1 is hydroxy.

Preferred are compounds of formula 1 as defined above wherein R^2 is t-butyl or $CH_2-C(CH_3)_3$. More preferably, R_2 is $CH_2-C(CH_3)_3$.

Preferably R^3 is t-butyl.

Preferably, compounds of formula 1 as defined above wherein R^4 is cyclopentyl or cyclohexyl. More preferably R^4 is cyclopentyl.

More preferably, a compound of formula 1 as defined above wherein R^1 is hydroxy, R^2 is $CH_2-C(CH_3)_3$, R^3 is t-butyl and R^4 is cyclopentyl.

More preferably, a compound of formula 1 wherein R^1 is hydroxy, R^2 and R^3 each is

t-butyl and R^4 is cyclopentyl.

More preferably, a compound of formula 1 wherein R^1 is hydroxy, R^2 is $CH_2-C(CH_3)_3$, R^3 is cyclohexyl and R^4 is cyclopentyl.

5

More preferably, a compound of formula 1 wherein R^1 is hydroxy, R^2 is $CH_2-C(CH_3)_3$, and R^3 and R^4 each is cyclohexyl.

More preferably, a compound of formula 1 wherein R^1 is hydroxy, R^2 is cyclopentylmethyl, R^3 is t-butyl, and R^4 is cyclobutyl.

10

More preferably, a compound of formula 1 wherein R^1 is hydroxy, R^2 is $CH_2-C(CH_3)_3$, R^3 is t-butyl and R^4 is cyclobutyl.

More preferably, a compound of formula 1 wherein R^1 is $NHSO_2Me$, R^2 is $CH_2-C(CH_3)_3$, R^3 is t-butyl and R^4 is cyclopentyl.

15

More preferably, a compound of formula 1 wherein R^1 is $NHSO_2Ph$, R^2 is $CH_2-C(CH_3)_3$, R^3 is t-butyl and R^4 is cyclopentyl.

20

According to an alternate embodiment, the pharmaceutical composition of this invention may additionally comprise another anti-HCV agent. Examples of anti-HCV agents include, α - (alpha), β - (beta), δ - (delta), γ - (gamma), tau- or ω - (omega) interferon, ribavirin and amantadine.

25

According to another alternate embodiment, the pharmaceutical composition of this invention may additionally comprise another inhibitor of HCV NS3 protease.

According to another alternate embodiment, the pharmaceutical composition of this invention may additionally comprise an inhibitor of HCV polymerase.

30

According to yet another alternate embodiment, the pharmaceutical composition of this invention may additionally comprise an inhibitor of other targets in the HCV life cycle, including but not limited to, helicase, NS2/3 protease or internal ribosome

entry site (IRES).

The pharmaceutical composition of this invention may be administered orally, parenterally or via an implanted reservoir. Oral administration or administration by
5 injection is preferred. The pharmaceutical composition of this invention may contain any conventional non-toxic pharmaceutically-acceptable carriers, adjuvants or vehicles. In some cases, the pH of the formulation may be adjusted with pharmaceutically acceptable acids, bases or buffers to enhance the stability of the formulated compound or its delivery form. The term parenteral as used herein
10 includes subcutaneous, intracutaneous, intravenous, intramuscular, intra-articular, intrasynovial, intrasternal, intrathecal, and intralesional injection or infusion techniques.

The pharmaceutical composition may be in the form of a sterile injectable
15 preparation, for example, as a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to techniques known in the art using suitable dispersing or wetting agents (such as, for example Tween 80) and suspending agents.

20 The pharmaceutical composition of this invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, and aqueous suspensions and solutions. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a
25 capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are administered orally, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavoring and/or coloring agents may be added.

30 Other suitable vehicles or carriers for the above noted formulations and compositions can be found in standard pharmaceutical texts, e.g. in "Remington's Pharmaceutical Sciences", The Science and Practice of Pharmacy, 19th Ed. Mack Publishing Company, Easton, Penn., (1995).

Dosage levels of between about 0.01 and about 100mg/kg body weight per day, preferably between about 0.1 and about 50mg/kg body weight per day of the protease inhibitor compound described herein are useful in a monotherapy for the prevention and treatment of HCV mediated disease. Typically, the pharmaceutical composition of this invention will be administered from about 1 to about 5 times per day or alternatively, as a continuous infusion. Such administration can be used as a chronic or acute therapy. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. A typical preparation will contain from about 5% to about 95% active compound (w/w). Preferably, such preparations contain from about 20% to about 80% active compound.

As the skilled artisan will appreciate, lower or higher doses than those recited above may be required. Specific dosage and treatment regimens for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health status, sex, diet, time of administration, rate of excretion, drug combination, the severity and course of the infection, the patient's disposition to the infection and the judgment of the treating physician. Generally, treatment is initiated with small dosages substantially less than the optimum dose of the peptide. Thereafter, the dosage is increased by small increments until the optimum effect under the circumstances is reached. In general, the compound is most desirably administered at a concentration level that will generally afford antivirally effective results without causing any harmful or deleterious side effects.

When the composition of this invention comprise a combination of a compound of formula I and one or more additional therapeutic or prophylactic agent, both the compound and the additional agent should be present at dosage levels of between about 10 to 100%, and more preferably between about 10 and 80% of the dosage normally administered in a monotherapy regimen.

When these compounds or their pharmaceutically acceptable salts are formulated together with a pharmaceutically acceptable carrier, the resulting composition may be administered *in vivo* to mammals, such as man, to inhibit HCV NS3 protease or

to treat or prevent HCV virus infection. Such treatment may also be achieved using a compound of this invention in combination with agents which include, but are not limited to: α -, β -, δ -, ω -, tau- or γ -interferon, ribavirin, amantadine; other inhibitors of HCV NS3 protease; inhibitors of HCV polymerase, inhibitors of other targets in the HCV life cycle, which include but not limited to, helicase, NS2/3 protease, or internal ribosome entry site (IRES); or combinations thereof. The additional agents may be combined with compounds of this invention to create a single dosage form. Alternatively these additional agents may be separately administered to a mammal as part of a multiple dosage form.

10

Accordingly, another embodiment of this invention provides a method of inhibiting HCV NS3 protease activity in a mammal by administering a compound of the formula I.

15 In a preferred embodiment, this method is useful in decreasing the NS3 protease activity of the hepatitis C virus infecting a mammal.

If the pharmaceutical composition comprises only a compound of this invention as the active component, such method may additionally comprise the step of administering to said mammal an agent selected from an immunomodulatory agent, an antiviral agent, a HCV NS3 protease inhibitor, an inhibitor of HCV polymerase or an inhibitor of other targets in the HCV life cycle such as helicase, NS2/3 protease or IRES. Such additional agent may be administered to the mammal prior to, concurrently with, or following the administration of the composition of this invention.

25

A compound of formula 1 set forth herein may also be used as a laboratory reagent. A compound of this invention may also be used to treat or prevent viral contamination of materials and therefore reduce the risk of viral infection of laboratory or medical personnel or patients who come in contact with such materials (e.g. blood, tissue, surgical instruments and garments, laboratory instruments and garments, and blood collection apparatuses and materials).

30

A compound of formula 1 set forth herein may also be used as a research reagent. A compound of formula 1 may also be used as positive control to validate surrogate

cell-based assays or *in vitro* or *in vivo* viral replication assays.

Further details of the invention are illustrated in the following examples which are understood to be non-limiting with respect to the appended claims.

5

EXAMPLES

Temperatures are given in degrees Celsius. Solution percentages express a weight to volume relationship, and solution ratios express a volume to volume relationship, unless stated otherwise. Nuclear magnetic resonance (NMR) spectra were
10 recorded on a Bruker 400 MHz spectrometer; the chemical shifts (δ) are reported in parts per million. Flash chromatography was carried out on silica gel (SiO₂) according to Still's flash chromatography technique (W.C. Still et al., J. Org. Chem., (1978), 43, 2923).

15 Abbreviations used in the examples include: DBU: 1,8-diazabicyclo[5.4.0]undec-7-ene; DCM: dichloromethane; DIEA: diisopropylethylamine; DIPEA: diisopropylethylamine; DMF: N, N-dimethylformamide; DMAP: 4-(dimethylamino)pyridine; EtOAc: ethyl acetate; HATU: [O-7-azabenzotriazol-1-yl]-1,1,3,3-tetramethyluronium hexafluorophosphate]; HPLC: high performance liquid
20 chromatography; MS: mass spectrometry (MALDI-TOF: Matrix Assisted Laser Desorption Ionization-Time of Flight, FAB: Fast Atom Bombardment); Me: methyl; MeOH: methanol; Ph: phenyl; R.T.: room temperature (18 to 22°); *tert*-butyl or *t*-butyl: 1,1-dimethylethyl; Tbg: *tert*-butyl glycine: *tert*-leucine; TFA: trifluoroacetic acid; and THF: tetrahydrofuran.

25

Synthesis of compounds of formula (I):

In general, the compounds of formula 1, and intermediates therefore, are prepared by known methods using reaction conditions which are known to be suitable for the reactants. Several such methods are disclosed in WO 00/09543, WO 00/09558 and
30 US Pat. No. 6,323,180, incorporated herein by reference.

Preparation of Thioureas**Preparation of Thiourea 2a**

- Thiourea (5.0 gm, 66mmol) was dissolved in toluene (50mL) and *tert*-butylacetyl chloride (8.88 gm, 66mmol) was added. The mixture was heated at reflux for 14h to give a yellow solution. The mixture was concentrated to dryness, and the residue partitioned between EtOAc and sat. NaHCO₃. The yellow organic phase was dried over MgSO₄, filtered and concentrated to give a yellow solid. The solid was dissolved into a minimum amount of EtOAc and triturated with hexane to give **2a** as a white solid (8.52 g; 75%). M.S. (electrospray): 173 (M-H)- 175 (M+H)+. Reverse Phase HPLC Homogeneity (0.06 % TFA ; CH₃CN : H₂O) : 99 %.

Preparation of Thiourea 2b

- Using the procedure described above and using commercially available cyclopentyl acetyl chloride instead of *tert*-butylacetyl chloride yielded thiourea **2b**.

Synthesis of intermediates 3**Preparation of carbamate 3a**

- Tetrahydrofuran (350mL) was added to a flask containing carbonic acid cyclopentyl ester 2,5-dioxo-pyrrolidin-1-yl ester (9.00g; 39.6mmol) and *tert*-leucine (6.24g; 47.5mmol) resulting in a suspension. Distilled water (100mL) was added with vigorous stirring. A small amount of solid remained undissolved. Triethylamine (16.6mL; 119mmol) was then added resulting in a homogenous solution which was stirred at R.T.. After 2.5h, the THF was evaporated and the aqueous residue diluted

with water (100mL) and the reaction rendered basic by the addition of 1 N NaOH (25mL - final pH >10). The solution was washed with EtOAc (2 x 200mL) and the aqueous phase then acidified with 1 N HCl (ca. 70mL - final pH <2). The turbid solution was extracted with EtOAc (200 + 150mL). The extract was dried (MgSO₄) and evaporated to give compound **3a** as a white solid (8.68 g).

Preparation of carbamates **3b**, **3c**, and **3d**

Using the procedure described above and using appropriate combinations of *tert*-butyl glycine, or cyclohexyl glycine and carbonic acid cyclobutyl, cyclopentyl, or cyclohexyl ester 2,5-dioxo-pyrrolidin-1-yl ester, the following carbamates were prepared:

Preparation of intermediate **5**

Preparation of intermediate **5a**:

α -Bromoketone **4** (3.61g ; 5.71mmol) was combined with thiourea **2a** (1.09g ; 6.28mmol) in isopropanol (140mL) and the yellow solution was placed into a pre-heated oil bath of 70°C for 1.5h. The solution was cooled to R.T. and evaporated to dryness. The residue was dissolved in EtOAc. The EtOAc solution was washed with saturated NaHCO₃ (2x), water (2x) and brine (1x), dried (MgSO₄), and evaporated to give the product as an orange-brown foam. Flash column chromatography in 7:3 hexane : EtOAc removed the less polar impurities and 6:4 hexane : EtOAc provided pure product as a light yellow solid (3.05g ; 76%).

M.S.(electrospray) : 706.3 (M-H)⁻ 708.4 (M+H)⁺ . Reverse Phase HPLC

Homogeneity (0.06 % TFA; CH₃CN : H₂O) : 99 %.

Preparation of intermediate 5b:

Using the procedure described above and using thiourea **2b** instead of thiourea **2a**,

5 the corresponding intermediate **5b** is obtained:

Preparation of intermediate 5c:

Using the procedure described above and using commercially available thiourea

10 instead of thiourea **2a**, the corresponding intermediate **5c** is obtained:

EXAMPLE 1

Synthesis of Compound 100

15

Step 1: Preparation of intermediate 6a

Boc-Dipeptide **5a** (3.05g ; 4.31mmol) was dissolved in 4N HCl/dioxane (22mL).

After stirring at R.T. for 30 min., the HCl salt precipitated. MeOH (2mL) was added to dissolve the precipitate. After 2h, the reaction mixture was evaporated to

dryness. The resulting HCl salt was dissolved in DCM (22mL) and DIEA (3.0mL ; 17.24mmol); carbamate **3a** (1.15g ; 4.47mmol) and HATU (1.72g ; 4.516mmol) were added. The solution was stirred at R.T. for 6h. The mixture was then diluted with EtOAc and the solution washed with saturated NaHCO₃ (2x), water (2x) and brine (1x), dried (MgSO₄), filtered and evaporated to obtain compound **6a** as a yellow solid. Flash column chromatography eluting first with hexane : EtOAc 7:3 and then 6:4 afforded pure Me-ester **6a** as a white foam (3.25g ; 90%). M.S. (electrospray) : 831.4 (M-H)⁻ 833.4 (M+H)⁺ 855.4 (M+Na)⁺. Reverse Phase HPLC Homogeneity (0.06 % TFA ; CH₃CN : H₂O) : 98 %.

10

Step 2: Hydrolysis of Ester

Methyl ester **6a** (3.24mg; 3.89mmol) was dissolved in THF (40mL) and MeOH (20mL), and an aqueous solution of LiOH (1.63mg ; 38.9mmol in 25mL) was added.

The yellow reaction mixture was stirred for 5.5h and then concentrated to provide an off-white suspension. The suspension was dissolved in EtOAc and brine, prepared with deionized water. The pH of the resulting solution was adjusted to 6 by the addition of 1N HCl. The layers were separated and the aqueous layer further extracted with EtOAc (2x). The combined EtOAc extracts were washed with deionized water (2x), deionized water prepared brine (1x), dried (MgSO₄), filtered and evaporated to obtain compound **100** as a pale yellow-white solid (3.02g; 95% yield).

Conversion to Na Salt:

The neutral compound **100** (1.22g; 1.49mmol) was dissolved in MeOH (30mL) and 1 equivalent 0.01N NaOH (14.85mL) was added – no product precipitation. The clear yellow solution was concentrated, diluted with deionized water, frozen and lyophilized to obtain the product (Na salt) as a yellow-white amorphous solid (1.24g; 99 % yield)

Na Salt : MW : 840.98 $C_{42}H_{53}N_6O_9SNa$

M.S.(electrospray) : 817.3 (M-H)⁻ 819.4 (M+H)⁺ 841.4 (M+Na)⁺ . Reverse Phase HPLC Homogeneity (0.06 % TFA ; CH₃CN : H₂O) : 98 %.

¹H NMR (400 MHz,DMSO-d₆): ca, 6:1 mixture of rotamers ; δ 8.11-7.65 (m, 4H) ,
 5 7.33 (bs, 1H) , 7.18-6.97 (m, 2H), 6.36-6.08 (m, 1H), 5.55-5.33 (m, 1H), 4.98 (d, J = 18.0 Hz, 1H), 4.85 (bs, 1H), 4.80 (d, J = 10.4 Hz, 1H), 4.50-4.41 (m, 1H), 4.22-4.02 (m, 2H), 3.92 (s, 3H), 2.72-2.45 (m, 1H), 2.50 (under DMSO, s, 2H), 2.40-2.26 (m, 1H), 1.89-1.43 (m, 9H), 1.37-1.30 (m, 1H), 1.30-1.12 (m, 1H), 1.03 & 0.90 (2x s, 9H), 0.98 & 0.94 (2x s, 9H).

10

EXAMPLE 2

Synthesis of Compound 101

By following the same procedure as described in the first step of example 1, and
 15 using Boc-dipeptide **5c** instead of **5a**, compound **6b** was obtained.

Compound **6b** (70mg, 0.095mmol) was dissolved in 2mL of DCM and successively treated with DIEA (0.045mL, 0.26mmol) and pivaloyl chloride (0.015mL, 0.12mmol). After stirring for 1h at 40° an additional pivaloyl chloride (0.015mL, 0.12mmol) was
 20 added and stirring was continued for an additional 2h. After the solution was concentrated, the residue was dissolved in EtOAc. The solution was washed with a saturated solution of NaHCO₃ and brine, dried (MgSO₄) and concentrated to afford 82mg of crude compound **6c** which was used without purification.

Methyl ester derivative **6c** was hydrolyzed as in step 2 of example 1 and purified by
 25 preparative HPLC using a YMC Combi-Prep. ODS-AQ column, 50 x 20mm. ID, S - 5micron, 120 A, and a linear gradient program from 2 to 100% AcCN /water (0.06% TFA).

Fractions were analyzed by analytical HPLC, and the pure fractions were combined,

concentrated, frozen and lyophilized to yield compound **101** as the trifluoroacetate salt:

Compound 101

^1H NMR (400 MHz, DMSO- d_6): ca, 85:15 mixture of rotamers, major isomer

- 5 description; δ 8.56 (s, 1H), 8.40-8.22 (m, 1H), 8.17 (d, J = 8.9 Hz, 1H), 7.67 (bs, 1H), 7.52 (bs, 1H), 7.24-7.15 (m, 1H), 7.03 (d, J = 8.3 Hz, 1H), 5.78-5.67 (m, 1H), 5.61-5.53 (m, 1H), 5.19 (dd, J = 17.2, 1.6 Hz, 1H), 5.09-5.03 (m, 1H), 4.63-4.55 (m, 1H), 4.49-4.39 (m, 2H), 4.11-3.92 (m, 2H), 3.95 (s, 3H), 2.62-2.53 (m, 1H), 2.33-2.25 (m, 1H), 2.06-1.98 (m, 1H), 1.72-1.25 (m, 10H), 1.30 (s, 9H), 0.97 (s, 9H).
- 10 M.S.(electrospray) : 803.3 (M-H)⁻ 805.3 (M+H)⁺ . Reverse Phase HPLC Homogeneity (0.06 % TFA; CH₃CN : H₂O) : 97 %

EXAMPLE 3

Preparation of compound 102

- 15 By following the procedure described in example 1 and using carbamate **3d** instead of **3a** and using preparative HPLC to purify the final compound as described in example 2, compound **102** was obtained as the trifluoroacetate salt:

Compound 102

^1H NMR (400 MHz, DMSO- d_6): ca, 90:10 mixture of rotamers, major isomer

- 20 description; δ 12.37 (s, 1H), 8.54 (s, 1H), 8.40-8.06 (m, 2H), 7.67-7.40 (m, 2H), 7.26 (d, J = 8.0 Hz, 1H), 7.26-7.13 (m, 1H), 5.77-5.65 (m, 1H), 5.62-5.49 (m, 1H), 5.23-5.16 (m, 1H), 5.10-5.03 (m, 1H), 4.57-4.37 (m, 3H), 4.03-3.88 (m, 2H), 3.94 (s, 3H), 2.64-2.54 (m, 1H), 2.41 (s, 2H), 2.37-2.22 (m, 1H), 2.04-1.95 (m, 1H), 1.79-1.21 (m,

16H), 1.17-0.85 (m, 5H), 1.04 (s, 9H).

M.S.(electrospray) : 843.5 (M-H)⁻ 845.4 (M+H)⁺ . Reverse Phase HPLC

Homogeneity (0.06 % TFA; CH₃CN : H₂O) : 99 %

5 EXAMPLE 4

Preparation of compound 103

Compound 103

By following the procedure described in example 1 but using carbamate **3c** instead of **3a** and using preparative HPLC to purify the final compound as described in

10 example 2, compound **103** was obtained as the trifluoroacetate salt:

¹H NMR (400 MHz, DMSO-d₆): ca, 85:15 mixture of rotamers, major isomer description; δ 12.35 (s, 1H), 8.52 (m, 1H), 8.43-8.06 (m, 2H), 7.67-7.41 (m, 2H), 7.26 (d, J = 7.8 Hz, 1H), 7.24-7.11 (m, 1H), 5.77-5.65 (m, 1H), 5.62-5.48 (m, 1H), 5.23-5.15 (m, 1H), 5.10-5.03 (m, 1H), 4.52-4.38 (m, 2H), 4.15-4.05 (m, 1H), 4.03-3.89 (m, 15 2H), 3.94 (s, 3H), 2.63-2.52 (m, 1H), 2.41 (s, 2H), 2.35-2.23 (m, 1H), 2.05-1.96 (m, 1H), 1.81-1.41 (m, 11H), 1.38-0.86 (m, 12H), 1.04 (s, 9H).

M.S.(electrospray) : 857.5 (M-H)⁻ 859.4 (M+H)⁺ . Reverse Phase HPLC

Homogeneity (0.06 % TFA; CH₃CN : H₂O) : 99 %

20 EXAMPLE 5

Preparation of compound 104

Compound 104

By following the procedure described in example 1 but using carbamate **3b** instead

of **3a** and Boc-dipeptide **5b** instead of **5a** and using preparative HPLC to purify the final compound as described in example 2, compound **104** was obtained as the trifluoroacetate salt:

¹H NMR (400 MHz, DMSO-d₆): ca, 3:1 mixture of rotamers ; δ8.02 (s, 1H) , 7.90 (s, 1H) , 7.84 (d, J = 7.0Hz, 1H) , 7.70 (s, 1H) , 7.33 (d, J = 2.2 Hz, 1H), 7.14 (dd, J = 2.5, 8.2 Hz, 1H), 7.09 (dd, J = 2.2, 9.2 Hz, 1H), 6.29-6.08 (m, 1H), 5.54-5.32 (m, 1H), 4.99 (d, J = 15.9Hz, 1H), 4.80 (d, J = 10.0 Hz, 1H), 4.76-4.64 (m, 1H), 4.46 (dd, J = 6.7 , 13.9 Hz, 1H), 4.19-4.08 (m, 3H), 3.92 (s, 3H), 2.70-2.61 (m, 2H), 2.37-2.09 (m, 4H), 2.03-1.82 (m, 1H), 1.85 (bs, 2H), 1.77-1.44 (m, 8H), 1.35-1.29 (m, 1H), 1.29-1.15 (m, 4H), 0.98 & 0.90 (2x s, 9H).
 M.S.(electrospray) : 815.3 (M-H)- 817.3 (M+H)+ . Reverse Phase HPLC
 Homogeneity (0.06 % TFA; CH₃CN : H₂O) : 98 %.

EXAMPLE 6

15 Preparation of compound **105**

Compound **105**

By following the procedure described in example 1 but using carbamate **3b** instead of **3a** and using preparative HPLC to purify the final compound as described in example 2, compound **105** was obtained as the trifluoroacetate salt:

¹H NMR (400 MHz, DMSO-d₆): ca, 7:1 mixture of rotamers ; δ8.58 (s, 1H) , 8.19 (d, J = 8.0Hz, 1H) , 7.76-7.50 (m, 2H), 7.35-7.20 (m, 1H), 7.19 (d, J = 8.0 Hz, 1H), 5.78-5.67 (m, 1H), 5.65-5.50 (m, 1H), 5.19 (d, J = 17.0 Hz, 1H), 5.07 (d, J = 10.2 Hz, 1H), 4.51-4.42 (m, 2H), 4.42-4.31 (m, 1H), 4.02 (d, J = 7.4 Hz, 1H), 4.02-3.93 (m, 1H), 3.97 (s, 3H), 2.63-2.52 (m, 1H), 2.42 (s, 2H), 2.35-2.25 (m, 1H), 2.07-1.95 (m, 3H), 1.90-1.76 (m, 1H), 1.70-1.41 (m, 3H), 1.30-1.23 (m, 1H), 1.04 (s, 9H), 0.96 & 0.87 (2xs, 9H),

M.S.(electrospray) : 803.4 (M-H)- 805.4 (M+H)+ . Reverse Phase HPLC

Homogeneity (0.06 % TFA; CH₃CN : H₂O) : 98 %.

EXAMPLE 7

Preparation of compound 106

- 5 Compound 100 of example 1 (29.8mg, 0.036mmol) was combined with HATU (1.2 equiv., 19.7mg, 0.052mmol) and dissolved in anhydrous DMF (4mL). The solution was stirred at R.T. and DIPEA (5 equiv., 31.4μL, 0.18mmol) was added dropwise over *ca.* 1 min.. The mixture was stirred for 20min. at R.T. and analyzed by
- 10 analytical HPLC for the formation of the activated ester. A solution of methanesulfonamide (5.8equiv., 19.7mg, 0.207mmol), DMAP (5.4equiv., 23.5mg, 0.193mmol) and DBU (4.8equiv., 25.8μL, 0.172mmol) was added in DMF (1mL). The reaction mixture was stirred 16h at R.T. before being concentrated *in vacuo*. The residue was reconstituted in DMSO and purified by preparative HPLC.
- 15 Lyophilization gave the final product (23mg, 71.3%) as an off-white amorphous solid.
- ¹H-NMR (400MHz, DMSO-d₆), δ12.35 (s, 1H), 10.53 (s, 1H), 8.87 (s, 1H), 8.40-8.20 (m, 1H), 8.17 (d, *J* = 8.8 Hz, 1H), 7.61 (bs, 1H), 7.51 (bs, 1H), 5.67-5.55 (m, 2H), 5.23-5.18 (m, 1H), 5.10 (d, *J* = 12 Hz, 1H), 4.68-4.57 (m, 1H), 4.50 (bd, *J* = 12 Hz,
- 20 1H), 4.46-4.37 (m, 1H), 4.07 (d, *J* = 8.0 Hz, 1H), 3.95 (s, 3H), 3.17 (s, 3H), 2.78-2.58 (m, 1H), 2.42 (s, 2H), 2.29-2.19 (m, 1H), 2.19-2.09 (m, 1H), 1.71 (dd, *J* = 7.8, 7.6 Hz, 1H), 1.67-1.55 (m, 4H), 1.55-1.37 (m, 4H), 1.04 (s, 9H), 0.98 (s, 9H), 0.97-0.87 (m, 2H).
- MS (electrospray): 896.5 (M + H)⁺, and 894.5 (M - H)⁻.
- 25 RP-HPLC: Rt = 6.7 minutes (homogeneity = 100%).

EXAMPLE 8**Preparation of compound 107**

Compound 107

- Using the same procedure described in Example 7 and using benzenesulfonamide instead of methylsulfonamide gave compound 107 as a pale yellow amorphous solid in 54% yield.

¹H NMR (DMSO-d₆) δ 12.39 (s, 1H), 10.89 (s, 1H), 8.83 (s, 1H), 8.40-8.22 (m, 1H), 8.18 (d, *J* = 8.4 Hz, 1H), 7.90 (s, 1H), 7.88 (s, 1H), 7.67-7.63 (m, 1H), 7.63-7.54 (m, 3H), 7.54-7.45 (m, 1H), 7.30-7.15 (m, 1H), 7.10 (d, *J* = 7.8 Hz, 1H), 5.62-5.51 (m, 1H), 5.38-5.26 (m, 1H), 5.16-5.08 (m, 1H), 4.93 (d, *J* = 10.4 Hz, 1H), 4.70-4.58 (m, 1H), 4.57-4.49 (m, 1H), 4.48-4.39 (m, 1H), 4.09 (d, *J* = 7.8 Hz, 1H), 3.95 (s, 3H), 2.69-2.59 (m, 1H), 2.41 (s, 2H), 2.28-2.16 (m, 1H), 2.14-2.04 (m, 1H), 1.72-1.52 (m, 4H), 1.51-1.37 (m, 4H), 1.29-1.22 (m, 1H), 1.03 (s, 9H), 1.00 (s, 9H), 0.99-0.92 (m, 1H).

- MS (electrospray); 958.5 (*M* + *H*)⁺, and 956.5 (*M* - *H*)⁻.
RP-HPLC: *R*_t = 7.2 minutes (homogeneity = 95%).

EXAMPLE 9**NS3-NS4A protease assay**

- The enzymatic assay used to evaluate the present compound is described in WO 00/09543 and WO 00/59929.

EXAMPLE 10**Cell Based HCV RNA Replication Assay**

- Cell Culture

Huh7 cells that stably maintain a subgenomic HCV replicon were established as previously described (Lohman et al., 1999. Science **285**: 110-113) and designated as the S22.3 cell-line. S22.3 cells are maintained in Dulbecco's Modified Earle

Medium (DMEM) supplemented with 10% FBS and 1mg/mL neomycin (Standard Medium). During the assay, DMEM medium supplemented with 10% FBS, containing 0.5% DMSO and lacking neomycin was used (Assay Medium). 16 hours prior to compound addition, S22.3 cells are trypsinized and diluted to 50 000 cells/ml in Standard Medium. 200µL (10 000 cells) are distributed into each well of a 96-well plate. The plate was then incubated at 37° with 5% CO₂ until the next day.

Reagents and Materials:

Product	Company	Catalog #	Storage
DMEM	Wisent Inc.	10013CV	4°C
DMSO	Sigma	D-2650	RT
Dulbecco's PBS	Gibco-BRL	14190-136	RT

Neomycin (G418)	Gibco-BRL	10131-027	-20°C/4°C
Trypsin-EDTA	Gibco-BRL	25300-054	-20°C/4°C
96-well plates	Costar	3997	RT
PVDF 0.22µm Filter Unit	Millipore	SLGV025LS	RT
Deep-Well Titer Plate Polypropylene	Beckman	267007	RT

10 Preparation of Test Compound

10µL of test compound (in 100% DMSO) was added to 2 ml of Assay Medium for a final DMSO concentration of 0.5% and the solution was sonicated for 15 min and filtered through a 0.22µm Millipore Filter Unit. 900µl was transferred into row A of a Polypropylene Deep-Well Titer Plate. Rows B to H, contain 400µL aliquots of Assay Medium (containing 0.5% DMSO), and are used to prepare serial dilutions (1/2) by transferring 400µl from row to row (no compound was included in row H).

Application of test compound to cells

Cell culture medium was aspirated from the 96-well plate containing the S22.3 cells.

20 175µL of assay medium with the appropriate dilution of test compound was transferred from each well of the compound plate to the corresponding well of the cell culture plate (row H was used as the "No inhibition control"). The cell culture plate was incubated at 37° with 5% CO₂ for 72h.

Extraction of Total Cellular RNA

Following the 72h incubation period, the total cellular RNA was extracted from the S22.3 cells of the 96-well plate using the RNeasy 96 kit (Qiagen®, RNeasy Handbook. 1999.). Briefly, assay medium was completely removed from cells and 100 µL of RLT buffer (Qiagen®) containing 143 mM β-mercaptoethanol was added to each well of the 96-well cell-culture plate. The microplate was gently shaken for 20 sec. 100 µL of 70% ethanol was then added to each microplate well, and mixed by pipetting. The lysate was removed and applied to the wells of a RNeasy 96 (Qiagen®) plate that was placed on top of a Qiagen® Square-Well Block. The RNeasy 96 plate was sealed with tape and the Square-Well Block with the RNeasy 96 plate was loaded into the holder and placed in a rotor bucket of a 4K15C centrifuge. The sample was centrifuged at 6000 rpm (~5600 x g) for 4 min at room temperature. The tape was removed from the plate and 0.8 ml of Buffer RW1 (Qiagen® RNeasy 96 kit) was added to each well of the RNeasy 96 plate. The RNeasy 96 plate was sealed with a new piece of tape and centrifuged at 6000 rpm for 4 min at room temperature. The RNeasy 96 plate was placed on top of another clean Square-Well Block, the tape removed and 0.8 ml of Buffer RPE (Qiagen® RNeasy 96 kit) was added to each well of the RNeasy 96 plate. The RNeasy 96 plate was sealed with a new piece of tape and centrifuged at 6000 rpm for 4 min at room temperature. The tape was removed and another 0.8 ml of Buffer RPE (Qiagen® RNeasy 96 kit) was added to each well of the RNeasy 96 plate. The RNeasy 96 plate was sealed with a new piece of tape and centrifuged at 6000 rpm for 10 min at room temperature. Tape was removed, the RNeasy 96 plate was placed on top of a rack containing 1.2-mL collection microtubes. The RNA was eluted by adding 50 µL of RNase-free water to each well, sealing plate with a new piece of tape and incubated for 1 min at room temperature. The plate was then centrifuged at 6000 rpm for 4 min at room temperature. The elution step was repeated with a second volume of 50 µl RNase-free water. The microtubes with total cellular RNA are stored at -70°.

Quantification of Total Cellular RNA

RNA was quantified on the STORM® system (Molecular Dynamics®) using the RiboGreen® RNA Quantification Kit (Molecular Probes®). Briefly, the RiboGreen

reagent was diluted 200-fold in TE (10mM Tris-HCl pH =7.5, 1mM EDTA).

Generally, 50µL of reagent was diluted in 10mL TE. A Standard Curve of ribosomal RNA was diluted in TE to 2µg/mL and pre-determined amounts (100, 50, 40, 20, 10, 5, 2 and 0µL) of the ribosomal RNA solution are then transferred in a new 96-well plate (COSTAR # 3997) and the volume was completed to 100µL with TE.

Generally, column 1 of the 96-well plate was used for the standard curve and the other wells are used for the RNA samples to be quantified. 10µL of each RNA sample that was to be quantified, was transferred to the corresponding well of the 96-well plate and 90µL of TE was added. One volume (100µL) of diluted RiboGreen reagent was added to each well of the 96-well plate and incubated for 2 to 5 minutes at room temperature, protected from light (a 10 µL RNA sample in a 200 µL final volume generates a 20 X dilution). The fluorescence intensity of each well was measured on the STORM® system (Molecular Dynamics®). A standard curve was created on the basis of the known quantities of the ribosomal RNA and the resulting fluorescent intensities. The RNA concentration in the experimental samples was determined from the standard curve and corrected for the 20X dilution.

Real-Time RT-PCR

The Real-Time RT-PCR was performed on the ABI Prism 7700 Sequence Detection System using the TaqMan EZ RT-PCR Kit from (Perkin-Elmer Applied Biosystems®). RT-PCR was optimized for the quantification of the 5' IRES of HCV RNA by using the Taqman technology (Roche Molecular Diagnostics Systems) similar to the technique previously described (Martell et al., 1999. J. Clin. Microbiol.

37: 327-332). The system exploits the 5'-3' nucleolytic activity of AmpliTaq DNA polymerase. Briefly, the method utilizes a dual-labeled fluorogenic hybridization probe (PUTR Probe) that specifically anneals to the template between the PCR primers (primers 8125 and 7028). The 5' end of the probe contains a fluorescent reporter (6-carboxyfluorescein [FAM]) and the 3' end contains a fluorescent quencher (6-carboxytetramethylrhodamine [TAMRA]). The FAM reporter's emission spectrum was suppressed by the quencher on the intact hybridization probe. Nuclease degradation of the hybridization probe releases the reporter, resulting in an increase in fluorescence emission. The ABI Prism 7700 sequence detector

5 measures the increase in fluorescence emission continuously during the PCR amplification such that the amplified product was directly proportion to the signal. The amplification plot was analysed early in the reaction at a point that represents the logarithmic phase of product accumulation. A point representing a defined detection threshold of the increase in the fluorescent signal associated with the

10 exponential growth of the PCR product for the sequence detector was defined as the cycle threshold (C_T). C_T values are inversely proportional to the quantity of input HCV RNA; such that under identical PCR conditions, the larger the starting concentration of HCV RNA, the lower the C_T . A standard curve was created automatically by the ABI Prism 7700 detection system by plotting the C_T against

15 each standard dilution of known HCV RNA concentration.

20

Reference samples for the standard curve are included on each RT-PCR plate. HCV Replicon RNA was synthesized (by T7 transcription) *in vitro*, purified and quantified by OD_{260} . Considering that $1\mu\text{g}$ of this RNA = 2.15×10^{11} RNA copies, dilutions are

25 made in order to have 10^8 , 10^7 , 10^6 , 10^5 , 10^4 , 10^3 or 10^2 genomic RNA copies / $5\mu\text{L}$. Total cellular Huh-7 RNA was also incorporated with each dilution (50ng / $5\mu\text{L}$). $5\mu\text{L}$ of each reference standard (HCV Replicon + Huh-7 RNA) was combined with $45\mu\text{L}$ of Reagent Mix, and used in the Real-Time RT-PCR reaction.

30 The Real-Time RT-PCR reaction was set-up for the experimental samples that were purified on RNeasy 96 –well plates by combining $5\mu\text{L}$ of each total cellular RNA sample with $45\mu\text{L}$ of Reagent Mix.

20

Following the termination of the RT-PCR reaction the data analysis requires setting of threshold fluorescence signal for the PCR plate and a standard curve was constructed by plotting the Ct value versus RNA copy number used in each reference reaction. The Ct values obtained for the assay samples are used to interpolate an RNA copy number based on the standard curve.

25

Finally, the RNA copy number was normalized (based on the RiboGreen RNA quantification of the total RNA extracted from the cell culture well) and expressed as genome equivalents / µg of total RNA [ge/µg].

30 The RNA copy number [g.e./µg] from each well of the cell culture plate was a measure of the amount of replicating HCV RNA in the presence of various concentrations of inhibitor. The % inhibition was calculated with the following equation:

$$100 - [(g.e./\mu g \text{ inh}) / (g.e./\mu g \text{ ctrl}) \times 100].$$

A non-linear curve fit with the Hill model was applied to the inhibition-concentration data, and the 50% effective concentration (EC_{50}) was calculated by the use of SAS software (Statistical Software System; SAS Institute, Inc. Cary, N.C.).

5

When the compounds of this invention were evaluated in the preceding enzymatic and cell based assays, the compounds were found to be highly active. More specifically, the compounds had IC_{50} 's below 0.1 μ M in the NS3-NS4A protease assay, and EC_{50} 's below 0.5 μ M in the cell based HCV RNA replication assay.

10

EXAMPLE 11

Specificity assays

The specificity assays used to evaluate the selectivity of this compound are described in WO 00/09543.

15

When the compounds were evaluated in the specificity assays, the compounds of formula 1 were found to be selective in that they do not show significant inhibition in the Human Leukocyte Elastase and Cathepsin B assays.

EXAMPLE 12

20

Pharmacokinetic properties

The present compounds also show good pharmacokinetic properties such as detectable plasma levels in the rat at 1 hour and 2h after an oral dose of 4 or 5mg/kg.

More explicitly, the following assay, an *in vivo* oral absorption screen, was used to determine plasma levels of test compounds in a rat after oral administration:

25

Materials and Methods:

1. Method used to pool compounds ("cassette selection"):

The selection of compounds to be pooled into a "cassette" was based on their structural similarity and physicochemical properties. A solid phase extraction method applicable to all the selected compounds was established. Based on the initial testing where each compound was spiked into rat plasma and run through HPLC or HPLC/MS at a concentration of 0.5 μ M, the retention time, ionic mass, and the possible separation among compounds by HPLC and/or HPLC/MS were used

30

as basis for pooling 3-4 compounds into one "cassette".

2. Oral vehicle and compound preparation:

Each "cassette" contains 3-4 compounds at 5 or 4mg/kg for each compound. The
5 cassettes were prepared as an oral suspension in 0.5% aqueous methylcellulose
and 0.3% of polyoxyethylene (20) sorbiton monooleate (Tween-80). The dosing
volume was 10ml/kg via oral gavage.

3. Dosing and plasma sampling:

10 Male Sprague Dawley rats were fasted overnight in individual cages, with access to
aqueous 10% dextrose. Two rats were dosed with each "cassette". Plasma
samples (~1 ml) were collected at 1 and 2h post-dosing from the 2 rats and pooled
for extraction and analysis.

15 **4. Compound extraction and analysis:**

From each cassette, plasma samples at 1 and 2h, blank plasma, blank plasma
spiked with all the compounds at 0.5 μ M of each, are extracted by the solid phase
extraction method. Samples were analyzed by HPLC and HPLC/MS for comparison
purpose. Plasma concentrations are estimated based on the single concentration of
20 0.5 μ M standard.

Results

When assayed in the preceding screen the compounds of examples 1 to 8 of this
invention were found to present in significant levels in the plasma at the 1 hour and
25 2 hour intervals following oral administration, averaging blood plasma levels of
0.83 μ M and 0.75 μ M respectively.

This demonstration of *in vivo* oral absorption for the tripeptide compounds of this
invention is noteworthy, in view of the poor oral absorption generally attributed to this
30 class of peptides. The ready oral absorption renders the compounds useful for
treating of HCV infection.

CLAIMS

1. A compound of formula (I):

wherein R^1 is hydroxy or $NHSO_2R^{1A}$ wherein R^{1A} is (C_{1-8}) alkyl, (C_{3-7}) cycloalkyl or $\{(C_{1-6})$ alkyl- (C_{3-7}) cycloalkyl $\}$, which are all optionally substituted from 1 to 3 times with halo, cyano, nitro, $O-(C_{1-6})$ alkyl, amido, amino or phenyl, or R^{1A} is C_6 or C_{10} aryl which is optionally substituted from 1 to 3 times with halo, cyano, nitro, (C_{1-6}) alkyl, $O-(C_{1-6})$ alkyl, amido, amino or phenyl; R^2 is t-butyl, $-CH_2-C(CH_3)_3$, or $-CH_2$ -cyclopentyl; R^3 is t-butyl or cyclohexyl and R^4 is cyclobutyl, cyclopentyl, or cyclohexyl; or a pharmaceutically acceptable salt thereof.

2. The compound of formula I according to claim 1, wherein R^1 is hydroxy, $NHSO_2Me$, $NHSO_2$ -cyclopropyl, or $NHSO_2Ph$.
3. The compound of formula I according to claim 2, wherein R^1 is $NHSO_2Me$ or hydroxy.
4. The compound of formula I according to claim 3, wherein R^1 is hydroxy.
5. The compound of formula I according to any one of claims 1 to 4, wherein R^2 is t-butyl or $CH_2-C(CH_3)_3$.
6. The compound of formula I according to claim 5, wherein R^2 is $CH_2-C(CH_3)_3$.
7. The compound of formula I according to any one of claims 1 to 6, wherein R^3 is t-butyl.
8. The compound of formula I according to any one of claims 1 to 7, wherein R^4 is cyclopentyl or cyclohexyl.
9. The compound of formula I according to claim 8, wherein R^4 is cyclopentyl.
10. The compound of formula I as defined in claim 1, wherein R^1 is hydroxy, R^2 is $CH_2-C(CH_3)_3$, R^3 is t-butyl and R^4 is cyclopentyl.
11. The compound of formula I as defined in claim 1, wherein R^1 is hydroxy, R^2 and R^3 each is t-butyl and R^4 is cyclopentyl.

12. The compound of formula I as defined in claim 1, wherein R^1 is hydroxy, R^2 is $CH_2-C(CH_3)_3$, R^3 is cyclohexyl and R^4 is cyclopentyl.
13. The compound of formula I as defined in claim 1, wherein R^1 is hydroxy, R^2 is $CH_2-C(CH_3)_3$, and R^3 and R^4 each is cyclohexyl.
14. The compound of formula I as defined in claim 1, wherein R^1 is hydroxy, R^2 is cyclopentylmethyl, R^3 is t-butyl, and R^4 is cyclobutyl.
15. The compound of formula I as defined in claim 1, wherein R^1 is hydroxy, R^2 is $CH_2-C(CH_3)_3$, R^3 is t-butyl and R^4 is cyclobutyl.
16. The compound of formula I as defined in claim 1, wherein R^1 is $NHSO_2Me$, R^2 is $CH_2-C(CH_3)_3$, R^3 is t-butyl and R^4 is cyclopentyl.
17. The compound of formula I as defined in claim 1, wherein R^1 is $NHSO_2Ph$, R^2 is $CH_2-C(CH_3)_3$, R^3 is t-butyl and R^4 is cyclopentyl.
18. A pharmaceutical composition comprising an anti-hepatitis C virally effective amount of a compound of formula I according to any one of claims 1 to 17, or a pharmaceutically acceptable salt thereof, in admixture with a pharmaceutically acceptable carrier medium or auxiliary agent.
19. The pharmaceutical composition according to claim 18, further comprising a therapeutically effective amount of one or more other anti-HCV agent.
20. The pharmaceutical composition according to claim 19, wherein said other anti-HCV agent is selected from: α -interferon or pegylated α -interferon.
21. The pharmaceutical composition according to claim 19 or 20, wherein said other anti-HCV agent is ribavirin.
22. The pharmaceutical composition according to claim 19, 20 or 21, wherein said other anti-HCV agent is selected from inhibitors of: helicase, NS2/3 protease and internal ribosome entry site (IRES).
23. A method for the treatment or prevention of a hepatitis C viral infection in a mammal by administering to the mammal an anti-hepatitis C virally effective amount of a compound of formula I according to any one of claims 1 to 17, or a pharmaceutically acceptable salt thereof.
24. A method for the treatment or prevention of a hepatitis C viral infection in a mammal by administering to the mammal an anti-hepatitis C virally effective amount of the composition according any one of claims 18 to 22.
25. A method for the treatment or prevention of a hepatitis C viral infection in a mammal by administering thereto an anti-hepatitis C virally effective amount of a compound

of formula I according to any one of claims 1 to 17, or a therapeutically acceptable salt thereof in combination with one or more other anti-HCV agent.

26. The method according to claim 25, wherein said other anti-HCV agent is selected from: α -interferon or pegylated α -interferon.
27. The method according to claim 25 or 26, wherein said other anti-HCV agent is ribavirin.
28. The method according to claim 25, 26 or 27, wherein said other anti-HCV agent is selected from inhibitors of: helicase, NS2/3 protease and internal ribosome entry site (IRES).
29. Use of a compound of formula I according to any one of claims 1 to 17 for the manufacture of a medicament for the treatment or prevention of hepatitis C viral infection.
30. The pharmaceutical composition according to claim 19, 20 or 21, wherein said other anti-HCV agent is an inhibitor of HCV polymerase.
31. The method according to claim 25, 26 or 27, wherein said other anti-HCV agent is an inhibitor of HCV polymerase.

A	WO 00 59929 A (BOEHRINGER INGELHEIM CA LTD ;GOUDREAU NATHALIE (CA); GHIRO ELISE () 12 October 2000 (2000-10-12) cited in the application the whole document -----	1-31

☐ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents :

A document defining the general state of the art which is not considered to be of particular relevance

E earlier document but published on or after the international filing date

L document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

O document referring to an oral disclosure, use, exhibition or other means

P document published prior to the international filing date but later than the priority date claimed

T later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

X document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

Y document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

& document member of the same patent family

Date of the actual completion of the international search

8 May 2003

Date of mailing of the international search report

14/05/2003

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2
